

Firm and curvy buttocks

THE PASSION OF OUR OLD CONTINENT FOR FIRM AND ROUNDED BUTTOCKS BARELY DATES BACK A DECADE. IT WAS TRIGGERED BY THE IMPETUS FROM BRAZIL, WHERE WOMEN IN G-STRINGS ON THE BEACHES DO NOT HESITATE TO HAVE IMPLANTS IN ORDER TO PARADE AN IMPECCABLE ANATOMY, FROM HEAD TO TOE. IF YOU ARE NOT COMPLETELY SATISFIED WITH YOUR BUTTOCKS, DISCOVER ALL THE SOLUTIONS FOR SLIMMING IT, FIRMING IT OR RESHAPING IT.

BUTTOCKS OUTLINE

PERFECT BEAUTY AUTUMN 2011

NOWADAYS BUTTOCKS NO LONGER WANT TO HAVE THE SHOW STOLEN BY BREASTS. WELL-SHAPED IN A TIGHT PAIR OF JEANS, SHOWN OFF AT THE SEASIDE OR OUTLINED BY THE SKILFUL WRAP OF A SKIRT, THEY ARE DEVLISHLY SEXY AND KNOW IT. FRANCE IS OF COURSE STILL A LONG WAY FROM BRAZIL, WHERE GLUTEAL IMPLANTS ARE COMMON. HOWEVER, OTHER VERY USEFUL SURGICAL TECHNIQUES EXIST FOR OBTAINING HARMONIOUS BUTTOCKS.

OPERATION SEDUCTION

01 GLUTEAL IMPLANTS

How does it work?

The operation lasts around 1 hour and is carried out under epidural or general anaesthetic. The surgeon makes a 3 cm incision at the level of the gluteal line, lifts the muscle, cuts the ligament and inserts the implant between the muscle and the hypodermis. He can also make an incision in the gluteus maximus and form a space within this muscle for inserting the implant.

THE ADVANTAGES

Gluteal implants facilitate immediate enlargement of the upper part of the buttock

THE INCONVENIENCES

They must not be used without lifting in cases of significant ptosis. One would in fact run the risk of finding oneself with double-tiered buttocks separated with a cross. As for the lower zone of the buttocks, it is traversed by the sciatic nerve. The operation is thus too delicate to be attempted.

GOOD TO KNOW

In France, there are still few surgeons able to fit this type of implant.

AFTER SURGERY

This intervention, very painful, necessitates taking analgesics. In addition sitting down is not allowed for 24 hours and lying on the back, for 1 week.

POSSIBLE COMPLICATIONS

*Badly positioned, the implant can become displaced
Risk of capsular contracture (hardening of the cicatricial layer forming a peri-prosthetic capsule)
Reintervention may then be necessary to resolve this problem
The implant may burst in the event of intramuscular injection
Risk of lymph effusion in 5% of cases with textured implants,
zero risk in cases of smooth implants*

HOW MUCH DOES IT COST?

Between 4,000 and 5,000 euros

THE UNIQUENESS OF SEBBIN IMPLANTS

Sebbin is a French company based in the Paris region. Specialised for the past 25 years in the design, creation, manufacture and marketing of silicone implants and high-quality expanders, it enjoys an excellent international reputation. With great respect for ethics, the company only uses very high quality raw materials. All its implants are individually and manually manufactured and inspected to ensure optimal safety for the surgeon and his patients. Besides its range of traditional implants, it makes the offer of working on a case-by-case basis to meet all the specific demands. As a leader in France on the gluteal implant market, it has just developed new products, which are intended not to migrate after being fitted under the gluteus muscle.
